Healthcare professionals are five times more likely to encounter violence on the job than other Americans.¹ These acts of violence compromise the safety and well-being of healthcare workers and patients not only in America but also worldwide.

According to the Occupational Safety and Health Administration (OSHA), “Workplace violence is any act or threat of physical violence, harassment, intimidation, or other threatening disruptive behavior that occurs at the work site. It ranges from threats and verbal abuse to physical assaults and even homicide.”²

Media headlines from the United States over the past few years show evidence that violence is prevalent in healthcare settings. For example:

- June 2021 — Combative Patient Tries to Attack Paramedics Stopped in Traffic in NY
- February 2021 — Four Healthcare Workers Shot at Allina Health Clinic in Minnesota
- January 2021 — Several Patients Overtook Staff at Cedar Springs Behavioral Health Services Hospital in Colorado Springs
- March 2019 — Male Patient Opened Fire Without Warning Outside the Eisenhower Desert Orthopedic Center in California
- April 2019 — Male Patient Attacks Two Nurses in Louisiana and One Nurse Dies

Globally, emerging patterns of violence against health facilities, ambulances, and staff have been recorded in the United States, Europe, the Middle East, Latin America, Asia, the Pacific,
and Africa during the COVID-19 pandemic. Examples of this global violence include the following:

- Two Nigerian nurses were attacked by the family of a deceased COVID-19 patient. One nurse had her hair ripped out and suffered a fracture. The second was beaten into a coma.
- Doctors at a hospital in Pakistan were verbally and physically attacked after a patient died of COVID-19 and relatives entered a high-risk area while shouting that coronavirus was a hoax.
- In Bangladesh, bricks were thrown at the house of a doctor after he tested positive for COVID-19 in an effort to force him and his family from the area.

In 2020, more than 1,100 attacks and threats of violence against healthcare workers, patients, facilities, and transport occurred worldwide, and nearly 400 appear to be specifically related to the COVID-19 pandemic, according to a report by Geneva, Switzerland-based Insecurity Insight and the University of California, Berkeley’s Human Rights Center. These attacks, which impeded COVID-19 response in several countries, included individual and collective assaults against healthcare workers caring for ill people, as well as coercion and punishment by security forces for speaking up about people’s healthcare needs.

Additionally, in the United States, 20 percent of those responding to a National Nurses United survey of 15,000 members conducted in the fall of 2020 said they had been physically attacked on the job.

The unfortunate reality is that healthcare workers are vulnerable to violence. It can occur in any geographic location and any type of facility, and violence can affect patients, doctors, allied health professionals, administrative staff, and families/caregivers. Although the previous examples from the media are extreme, and many incidents do not rise to the level of gunfire, they are considered violence nonetheless.

Further, according to the Centers for Disease Control and Prevention (CDC), underreporting of workplace violence is a problem. For example, verbal assaults, threats, and assaults that do
not cause permanent injuries (like spitting, slapping, pinching, kicking, etc.) might not be reported for various reasons, such as:

- Many healthcare workers accept violence as one of the risks of the job.
- Often times, patients or their families are under extreme levels of stress, creating an element of acceptance of bad behavior.
- Reporting structures are either not in place or are prohibitive because they are so complex and time consuming.
- Healthcare workers may fear the possibility of negative effects on their licenses, reputations, and/or employment.

The seriousness of this issue has prompted some states to pass laws that make the consequence of physical assault on a healthcare worker a felony. However, laws do not stop these situations from occurring and do not address all types of violence. Therefore, healthcare organizations — regardless of size — must be prepared for hostile or aggressive situations.

This article discusses important elements of a violence prevention program and offers strategies for preventing or managing violence before, during, and after an incident.

**Key Elements of a Violence Prevention Program**

In 2015, OSHA issued an updated version of its *Guidelines for Preventing Workplace Violence for Healthcare and Social Service Workers.* OSHA’s five major elements of an effective workplace violence prevention program include:

- **Management commitment and worker participation.** Teamwork is essential in a crisis situation. A well-trained team needs to be in place before an incident occurs so that team members are able to effectively execute the plan as needed.

- **Worksite analysis and hazard identification.** Worksite analysis consists of a methodical evaluation of the hazards within your environment, which may include hazards related to human factors and the physical building. Every facility has a unique
set of hazards that should be addressed. Simply put, ask yourself “Where am I vulnerable?”

- **Hazard prevention and control.** After the worksite analysis is completed, a team should review the information and develop a response plan to address vulnerabilities. The plan might include fixing a broken lock, making staffing modifications, installing video surveillance, developing policies, educating staff, implementing drills, or even changing workflow patterns. Again, each facility is different — what works for one might not be appropriate for another.

- **Safety and health training.** All staff should be properly trained on the security measures developed for their facility. Staff members need to be familiar with their roles and have an opportunity to practice. Tabletop drills have some value in educating staff initially, but physically practicing with drill activity is where the most value lies. The goal is to save lives, and everyone should be prepared. As Gandhi said, “An ounce of practice is worth more than tons of preaching.”

- **Recordkeeping and program evaluation.** Recordkeeping is an essential element of any business. Accurate recordkeeping allows an organization to stay on top of relevant issues. Whether it is incident reports, training history, or drill records, you need to have an accurate pulse on your facility to properly plan for the safety of your patients and staff. Program evaluation should be incorporated into the plan to capture the things you can improve on and the things you are doing well.

ECRI, an organization dedicated to improving the safety, quality, and cost-effectiveness of care across all healthcare settings, explains that “It is impossible to eliminate workplace violence in healthcare settings; however, there are ways to reduce the potential for violent occurrences and minimize the impact of any violent situation that may arise.”

The next few sections of this article will cover some strategies to consider when developing or evaluating violence prevention policies and plans.
Risk-Reduction Strategies: Before an Incident

The key to handling a violent incident is being prepared. Preparation involves assessing your facility, developing a response plan, educating your staff, and practicing your response.

Assess Your Facility

When assessing your facility, have a realistic view of the processes that are already in place. Reviewing policies, historical data, and community data related to violence can help you understand challenges and limitations as you begin developing a response plan.

However, you should not stop there. A physical assessment of your building and the established workflow also are very important in identifying your risk exposures. More details about the value, focus, and components of a worksite analysis are available in OSHA’s Guidelines for Preventing Workplace Violence for Healthcare and Social Service Workers.

Including staff that work in particular areas is vital during the assessment. They will be able to provide insight on risk exposures that might not be apparent while doing a walkthrough.

Develop a Response Plan

Research what other organizations similar to yours have done to respond to violent situations. Many good resources are available — but remember, you need to adapt them to meet your organization’s needs. For example, some facilities have “panic buttons” and have incorporated the use of those buttons into their response plans.

Although panic buttons are a good resource to incorporate into a plan, you may not have the funds or technology to implement them. In this situation, try to think outside the box on how to make a “panic button” concept work in your facility, and then modify your plans accordingly. As you develop a response plan, include all levels of staff on your team. This will foster engagement as you implement the plan.

Educate Your Staff

You can have a very well-written plan, but if you do not educate your staff on the process, it is meaningless. In an emergency situation, staff members need to be able to respond without
having to look up policies or read the violence prevention plan. The aggressor will not wait as your staff learns how to respond. Preparing your staff in advance is your best defense.

**Practice Your Response**

Practicing your response goes hand-in-hand with educating your staff. Once your staff members have been taught the concepts, give them the opportunity to work through the scenarios using a hands-on approach.

As noted earlier, table top exercises are good for learning concepts, but drills are where the real learning begins. Often times, steps are skipped or not well thought out when talking out a plan using the table top technique. Hands-on drills are valuable in (a) determining whether the plan has gaps, (b) identifying logistical issues, and (c) testing equipment along the way.

If staff members have the opportunity to walk through the scenario, there is a greater chance they will identify shortcomings in the response and retain the skills for when they are needed most.

**Risk-Reduction Strategies: During an Incident**

Understanding that no single response will work in every situation is crucial. An article from the *Western Journal of Emergency Medicine* notes four main objectives when working with an agitated person. They include:

- Ensuring the safety of the patient, staff, and others in the area
- Helping the patient (a) manage his/her emotions and distress, and (b) maintain or regain control of his/her behavior

**Simulation Scenarios**

MedPro’s Patient Safety & Risk Solutions Team has developed a booklet of sample scenarios for simulation training, which includes a behavioral health de-escalation scenario and an aggressive patient in an office practice scenario. Download the booklet to see these scenarios and incorporate them into your drills.
• Avoiding the use of restraint when possible
• Avoiding coercive interventions that escalate agitation

De-escalation is one technique that staff can be trained to use. The aforementioned article lists 10 domains of de-escalation,11 as follows:

1. Respect personal space while maintaining a safe position.
2. Do not be provocative.
3. Establish verbal contact.
4. Be concise; keep the message clear and simple.
5. Identify wants and feelings.
6. Listen closely to what the person is saying.
7. Agree or agree to disagree.
8. Lay down the law and set clear limits.
10. Debrief the patient and staff.

Details related to these domains can be found in the Western Journal of Emergency Medicine article noted in the Violence Emergency Resources box on page 8.

In the event that a situation does become violent, the response should be twofold: (1) isolate the aggressor in as limited an area as possible (such as locking the waiting room door to prevent access to the patient care area), and (2) evacuate as quickly as possible by all means of egress available. Determining a location to regroup is not necessary in this situation; escape from the dangerous environment is the goal.

If possible, call the police before a potential situation turns violent. This should be done sooner rather than later to allow the police time to respond to the scene.

For more information on planning for violent incidents, including active shooter situations, see the resources on the next page.

Risk-Reduction Strategies: After an Incident

After an incident, it is essential to bring the involved staff together to discuss it. This meeting not only offers a cathartic element by allowing staff to talk freely about the situation, but it also is a valuable method for improving incident response in the future.

The Agency for Healthcare Research and Quality has developed a debrief method that can be applied to any incident response situation. The essential questions to ask during a debriefing include:

- Was communication clear?
- Were roles and responsibilities understood?
- Was situational awareness maintained?
- Was the workload distribution equitable?
- Was task assistance requested or offered?
- Were errors made or avoided?
- Were resources available?
- What went well?
- What should improve?

The effects of violence can be earth shattering and linger for those involved. “Violent incidents can affect staffing as a result of lost work time from injuries, decreased job satisfaction leading to absenteeism and turnover, low employee morale, and fear of an unsafe workplace.” Providing for the physical safety and emotional support of staff members involved in a violent incident is an essential part of recovering from the incident and retaining these employees.

In Summary

Healthcare organizations need to have well-defined plans to address hostile/aggressive behavior. Preparing for violence emergencies requires an investment of time to develop and implement a comprehensive program. The program does not need to be complex or expensive.
to implement, but it should be thorough and practiced regularly. This investment of time far outweighs the loss that can occur if staff members are not alert and prepared to respond appropriately.
